

SafER Medical Products Announces Private Placement Funding Opportunity

SafER Medical Products Inc, is pleased to announce a new private placement funding opportunity for accredited investors. As detailed in the Private Placement Memorandum (PPM), this offering will raise a total of \$10 million, with the proceeds targeted to fuel SafER's next stage of rapid growth.

The offering is only open to Accredited Investors as defined by the SEC and the nominal minimum investment is \$100,000.

SafER is not just an idea on the horizon. SafER is the owner of TWO United States patents for its intellectual property, and patent pending in Italy, Japan, France, Germany, Australia and the United Kingdom. We have inventory, manufacturing molds, TUV and CE certified. We are currently in military and government catalogs and have FDA Compliance. Multiple studies have been done to prove our product works and several endorsements and awards have been earned.

This is especially demonstrated when healthcare personal must do an Aerosolized Generating Procedure or Nebulizer where patient illness is spread around the room exposing the healthcare provider and the room to the still unknown illness.

With the SafER System, the room or ambulance is no longer contaminated from Covid, Tuberculosis, influenza or the common cold. Simply wipe down the area the patient was touching and move to the next patient.

Picture this:

A front line healthcare professional can approach an unknown patient and use the SafER shield to create a Safe environment. Patients can now be treated, transported and delivered to the hospital without exposure to the still unknown illness.

Hospitals will leave the mask on and place the patient in a hospital negative pressure room, a normal exam room, an already occupied room or in the waiting area with 99.99% protection from respiratory contamination to other patients or staff.

SafER is the new latex glove of the respiratory system. A leading Pulmonologist on the East Coast has stated that he can do 50% more procedures by using the SafER Endo shield during bronchoscopies.

SafER Medical believes we can do better.

SafER Medical Products Announces Private Placement Funding Opportunity

Since our inception in July 2020, SafER has been on a mission to promote and establish SafER Portable Negative Pressure Systems (PNPS) within the healthcare industry to provide a safe work environment for emergency medical workers, respiratory therapists, caregivers, medical staff and patients. SafER is the Nebulizer of the future and will change the industry of respiratory care. It is already being used in ER's, helicopters, ambulances and senior facilities.

By improving treatment flexibility to handle more patients simultaneously, SafER portable respiratory isolation systems will also significantly increase revenues for hospitals, senior care facilities, respiratory therapists and related practitioners.

SafER Medical's Respiratory Shield and Endoshield systems are easy to use, lightweight, and small enough to fit seamlessly into any size workspace.

At a tiny fraction of the cost of the current medical care standard for airborne respiratory illness, the revolutionary SafER system is 99.99% effective in preventing infected airborne particles from spreading.

The current gold standard for respiratory illness care and treatment is hospital negative pressure rooms, which are expensive capital investments and require time-consuming sanitation protocol between patients. Most hospitals have one negative pressure room IF AT ALL and overcrowding during flu season leads to longer waiting times, allowing the infected particles to spread to other patients in the hospital and to those providing care. Hospitals spend hundreds of thousands of dollars to install HEPA air filtration into the HVAC systems to control this.

With SafER, our goal is to keep the disease with the patient. In a typical hospital negative pressure room, air is exchanged at a rate of 12 times per hour. With SafER's Respiratory Shield, air is exchanged at a rate of 3.8 times per second.

The SafER system has worldwide application. There is no health care facility in the world that could not use the SafER Device. There is no ambulance, prison, doctor's office, chemotherapy/radiation clinic, dialysis center, nursing home, government disaster cache or military unit that could not benefit from containing airborne illnesses.

SafER is a very simple solution to a real world problem.

We have heard countless times, why wasn't this invented earlier!

SafER was created by practicing Emergency Room Doctors to do real world medicine.

WE ARE HERE TO HELP. Join the SafER team and invest in our future.
